

# The No-Marketing Bullshit Introduction to Couchbase Server 2.0 and ext/couchbase

Jan Lehnardt

@janl / jan@couchbase.com

# CouchBase

# Couchbase Server Features

- **Built-in clustering – All nodes equal**

- **Data replication with auto-failover**

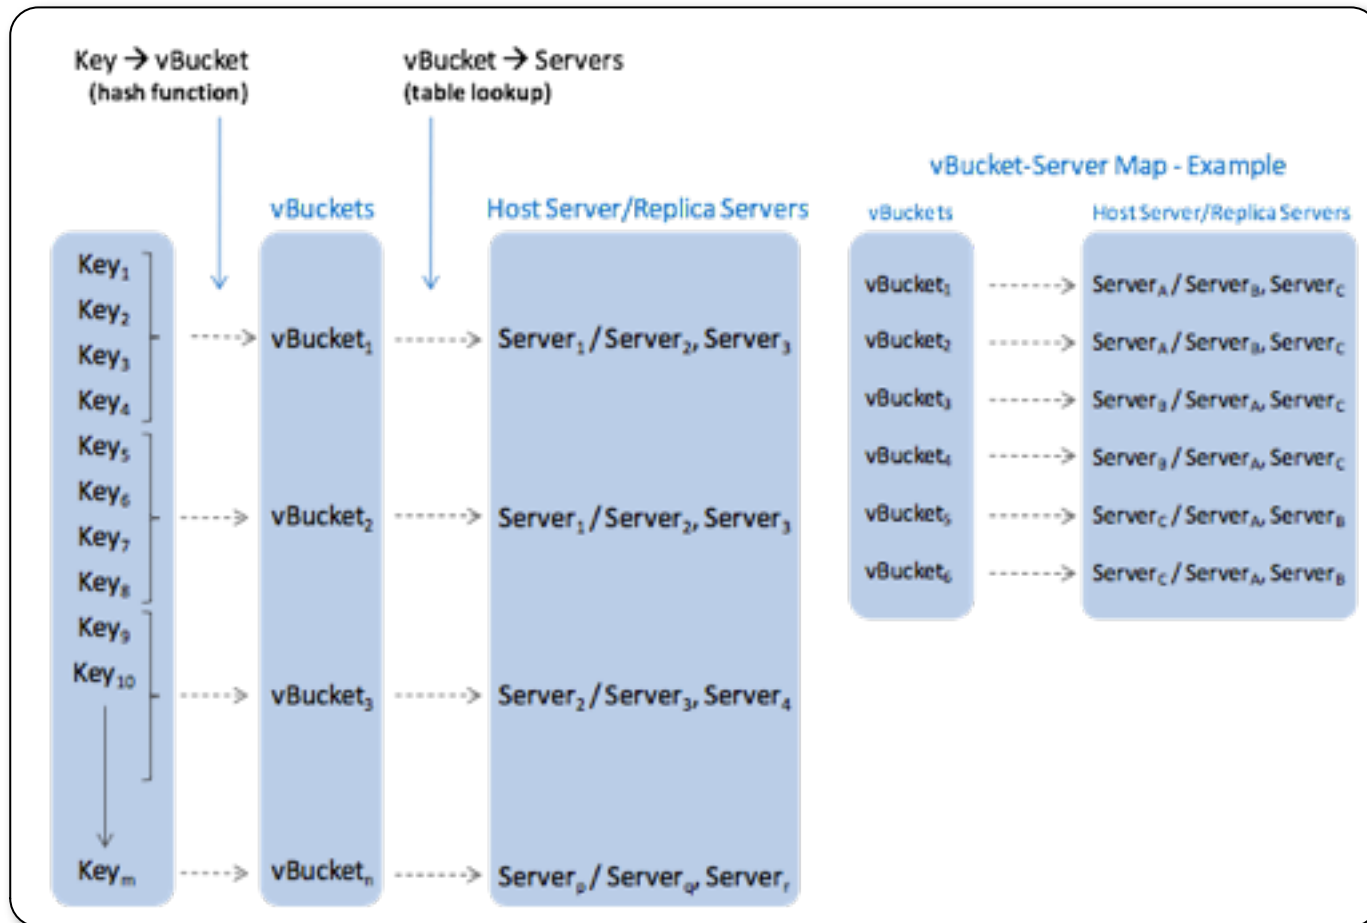

- **Zero-downtime maintenance**

- **Clone to grow and scale horizontally**

# Auto-sharding: vBuckets

# Couchbase Server Basic Operation

APP SERVER 1

APP SERVER 2

- Docs distributed evenly across servers in the cluster

SERVER 1

SERVER 2

SERVER 3

COUCHBASE SERVER CLUSTER

# Couchbase Server Basic Operation

APP SERVER 1

APP SERVER 2

- Docs distributed evenly across servers in the cluster
- Each server stores both *active* & *replica* docs
  - Only one server active at a time

SERVER 1

SERVER 2

SERVER 3

COUCHBASE SERVER CLUSTER

# Couchbase Server Basic Operation

APP SERVER 1

APP SERVER 2

- Docs distributed evenly across servers in the cluster
- Each server stores both *active* & *replica* docs
  - Only one server active at a time
- Client library provides app with simple interface to database

SERVER 1

SERVER 2

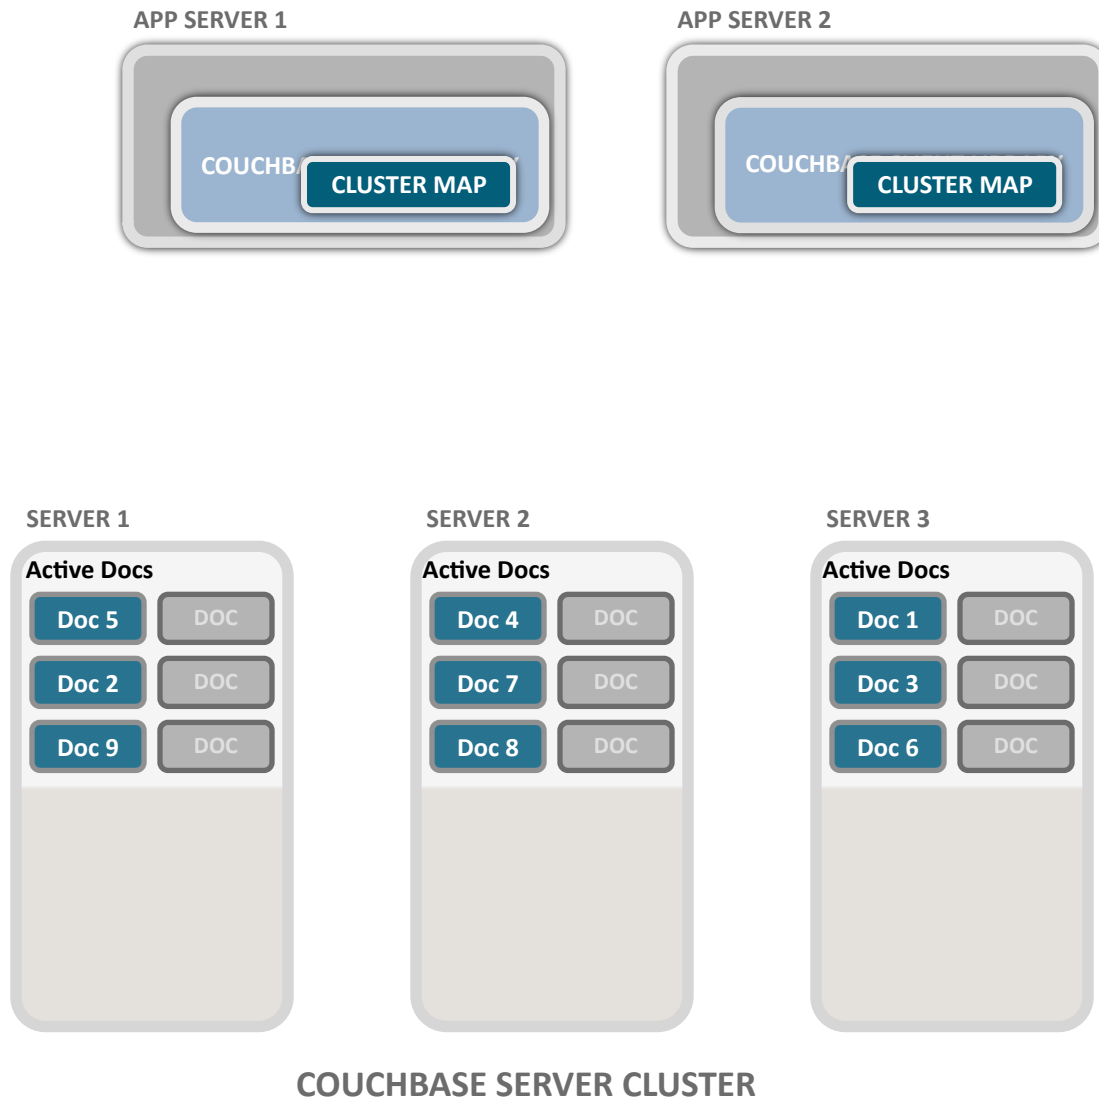

SERVER 3

COUCHBASE SERVER CLUSTER

# Couchbase Server Basic Operation

- Docs distributed evenly across servers in the cluster
- Each server stores both *active* & *replica* docs
  - Only one server active at a time
- Client library provides app with simple interface to database
- Cluster map provides map to which server doc is on
  - App never needs to know

# Couchbase Server Basic Operation

- Docs distributed evenly across servers in the cluster
- Each server stores both *active* & *replica* docs
  - Only one server active at a time
- Client library provides app with simple interface to database
- Cluster map provides map to which server doc is on
  - App never needs to know
- App reads, writes, updates docs

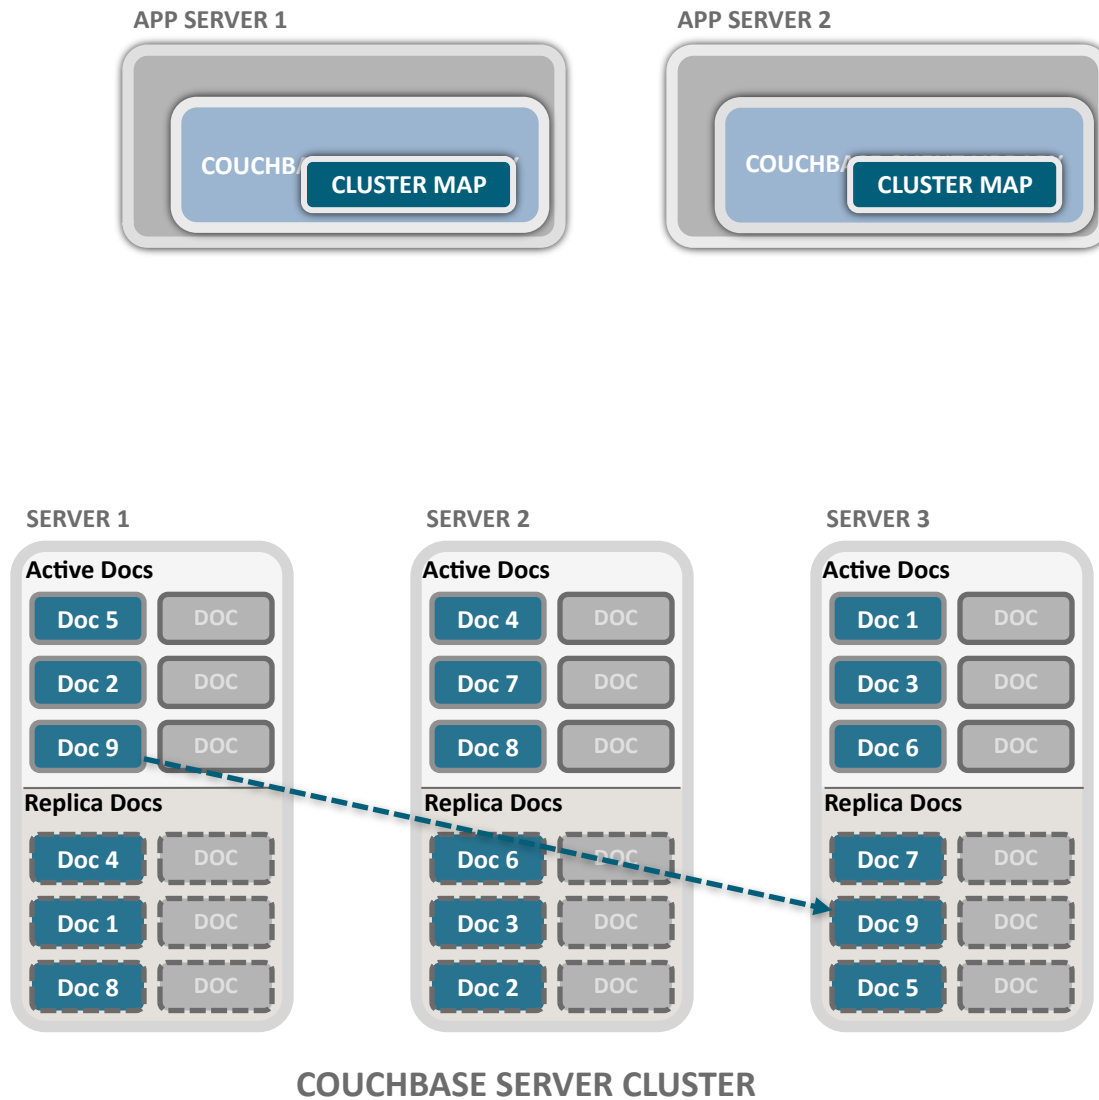

# Couchbase Server Basic Operation

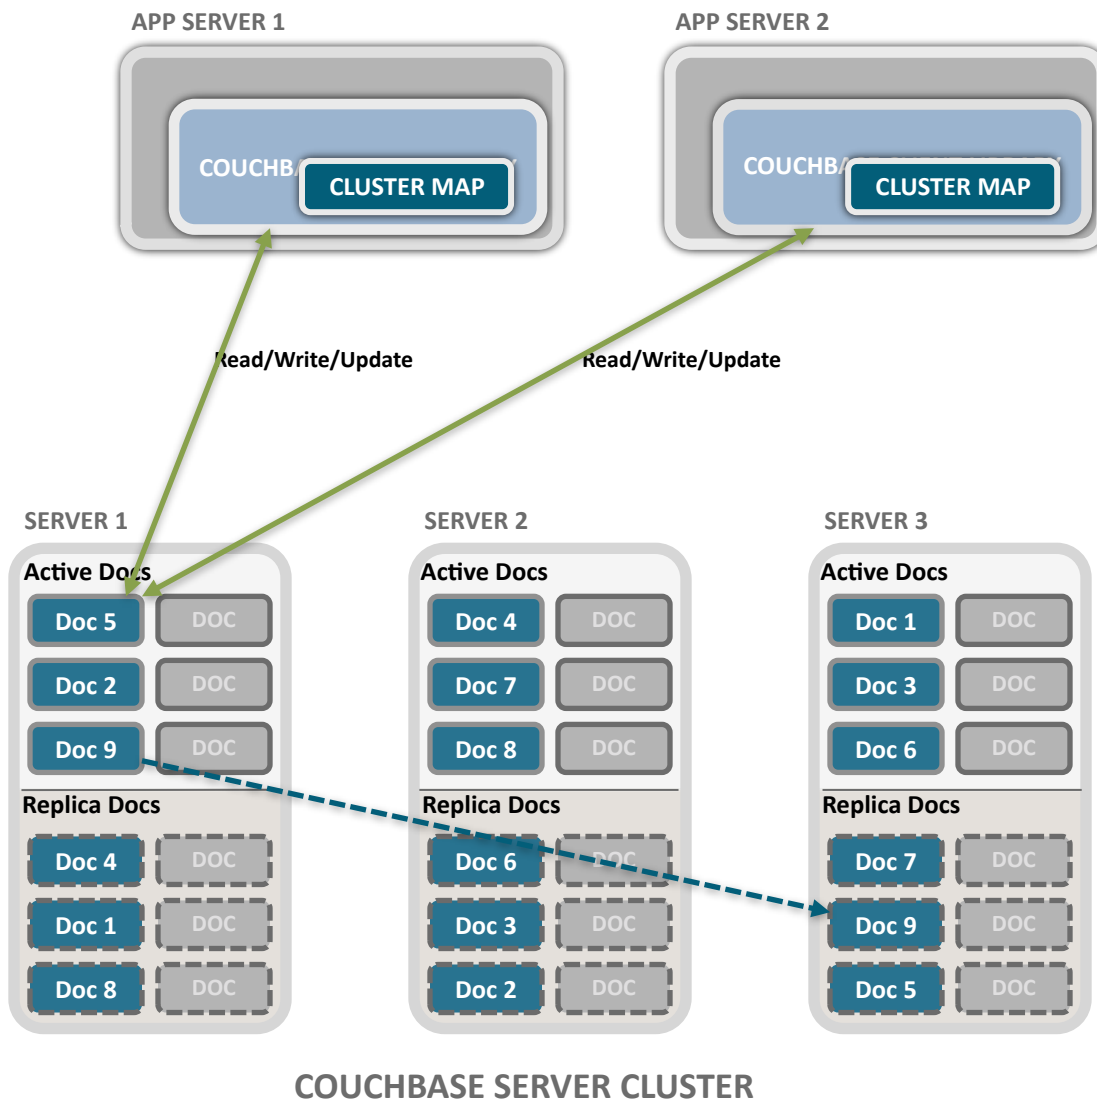

- Docs distributed evenly across servers in the cluster
- Each server stores both *active* & *replica* docs
  - Only one server active at a time
- Client library provides app with simple interface to database
- Cluster map provides map to which server doc is on
  - App never needs to know
- App reads, writes, updates docs
- Multiple App Servers can access same document at same time

# Couchbase Server Basic Operation

- Docs distributed evenly across servers in the cluster
- Each server stores both *active* & *replica* docs
  - Only one server active at a time
- Client library provides app with simple interface to database
- Cluster map provides map to which server doc is on
  - App never needs to know
- App reads, writes, updates docs
- Multiple App Servers can access same document at same time

COUCHBASE SERVER CLUSTER

# Add Nodes

APP SERVER 1

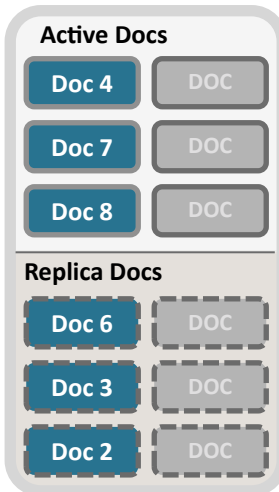

APP SERVER 2

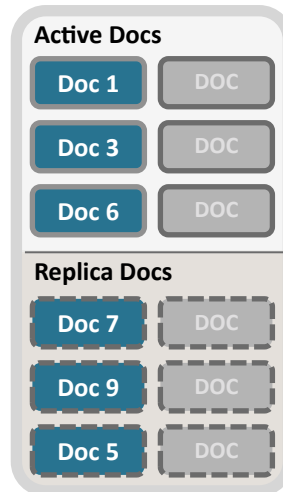

SERVER 1

SERVER 2

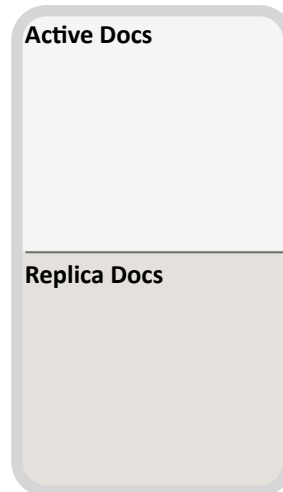

SERVER 3

SERVER 4

SERVER 5

COUCHBASE SERVER CLUSTER

# Add Nodes

APP SERVER 1

APP SERVER 2

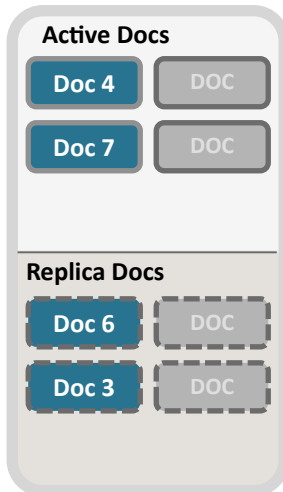

- Two servers added to cluster
  - One-click operation

SERVER 1

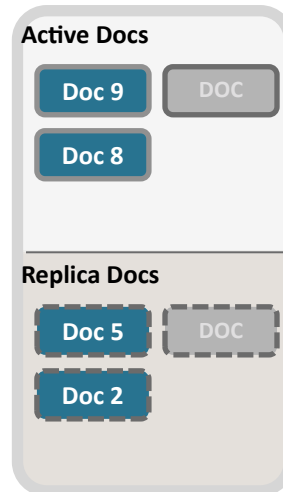

SERVER 2

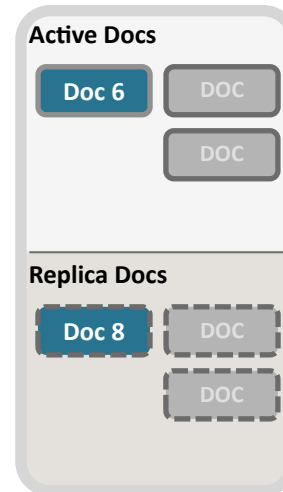

SERVER 3

SERVER 4

SERVER 5

COUCHBASE SERVER CLUSTER

# Add Nodes

APP SERVER 1

APP SERVER 2

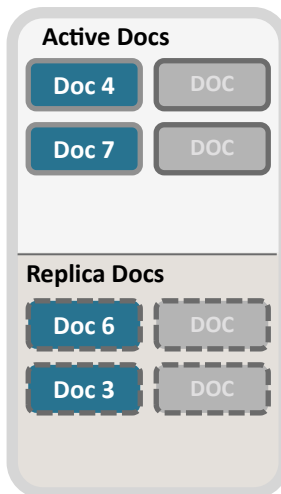

- Two servers added to cluster
  - One-click operation
- Docs automatically rebalanced across cluster
  - Even distribution of docs
  - Minimum doc movement

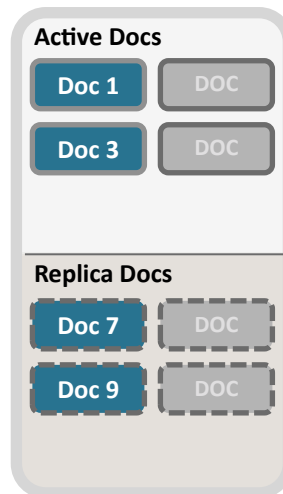

SERVER 1

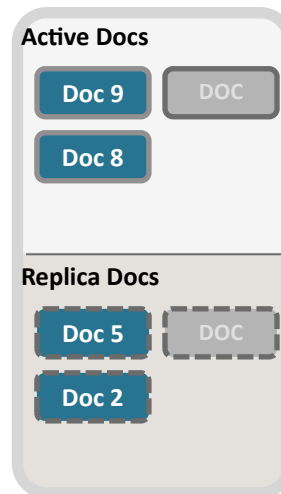

SERVER 2

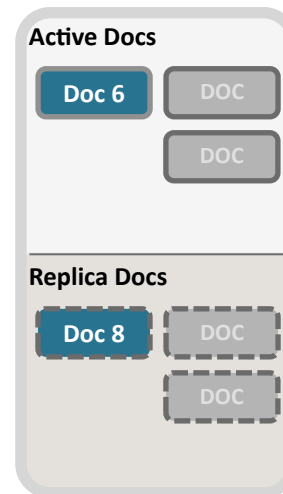

SERVER 3

SERVER 4

SERVER 5

COUCHBASE SERVER CLUSTER

# Add Nodes

APP SERVER 1

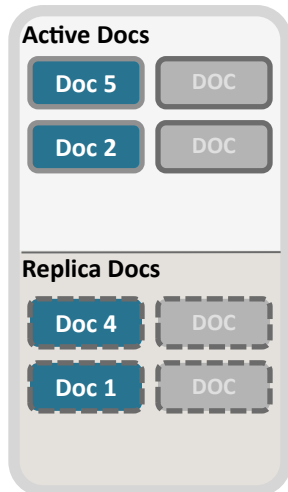

APP SERVER 2

- Two servers added to cluster
  - One-click operation
- Docs automatically rebalanced across cluster
  - Even distribution of docs
  - Minimum doc movement
- Cluster map updated

SERVER 1

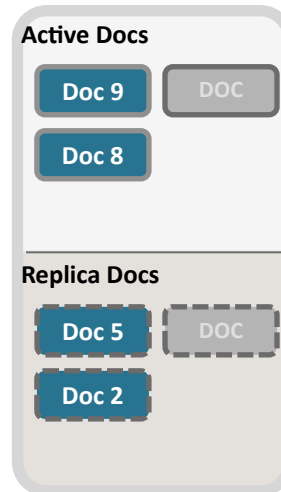

SERVER 2

SERVER 3

SERVER 4

SERVER 5

COUCHBASE SERVER CLUSTER

# Add Nodes

APP SERVER 1

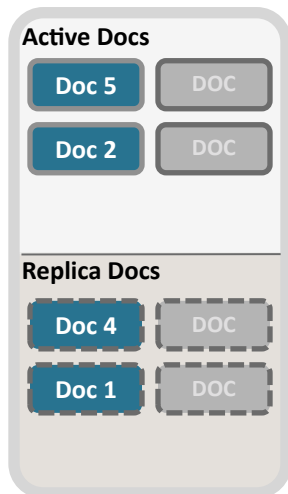

APP SERVER 2

- Two servers added to cluster
  - One-click operation
- Docs automatically rebalanced across cluster
  - Even distribution of docs
  - Minimum doc movement
- Cluster map updated
- App database calls now distributed over larger # of servers

SERVER 1

SERVER 2

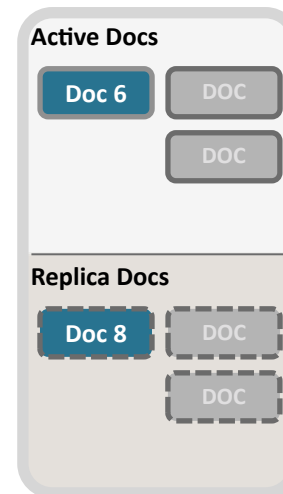

SERVER 3

SERVER 4

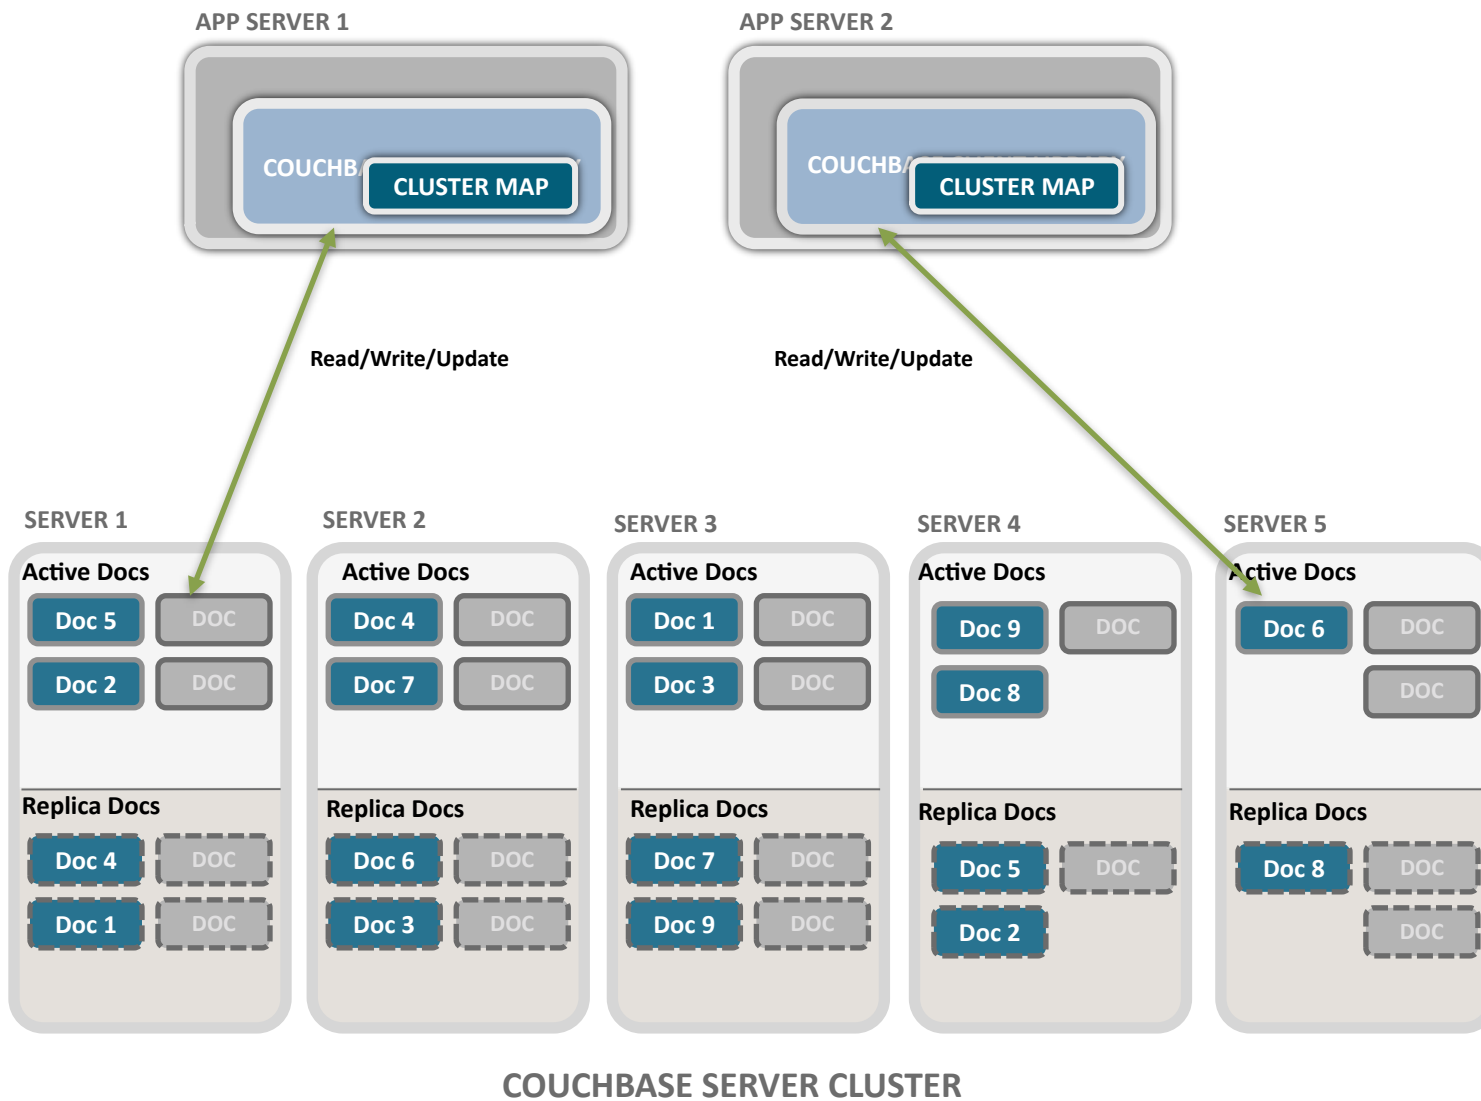

SERVER 5

COUCHBASE SERVER CLUSTER

# Add Nodes

- Two servers added to cluster
  - One-click operation
- Docs automatically rebalanced across cluster
  - Even distribution of docs
  - Minimum doc movement
- Cluster map updated
- App database calls now distributed over larger # of servers

# Fail Over Node

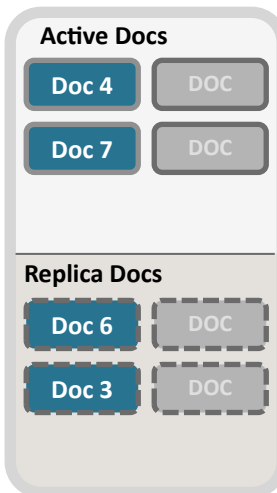

- App servers happily accessing docs on Server 3
- Server fails
- App server requests to server 3 fail
- Cluster detects server has failed
  - Promotes *replicas* of docs to *active*
  - Updates *cluster map*
- App server requests for docs now go to appropriate server
- Typically rebalance would follow

SERVER 1

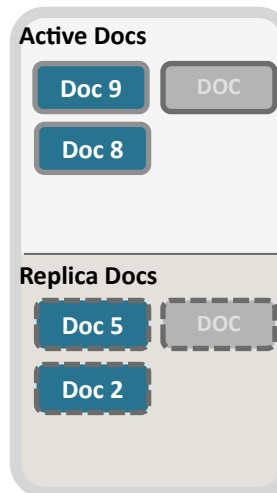

SERVER 2

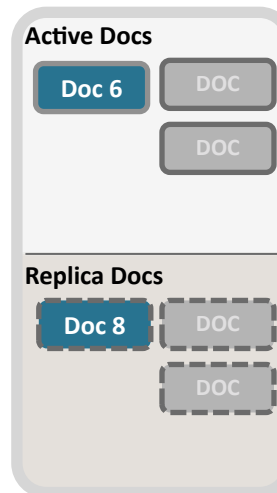

SERVER 3

SERVER 4

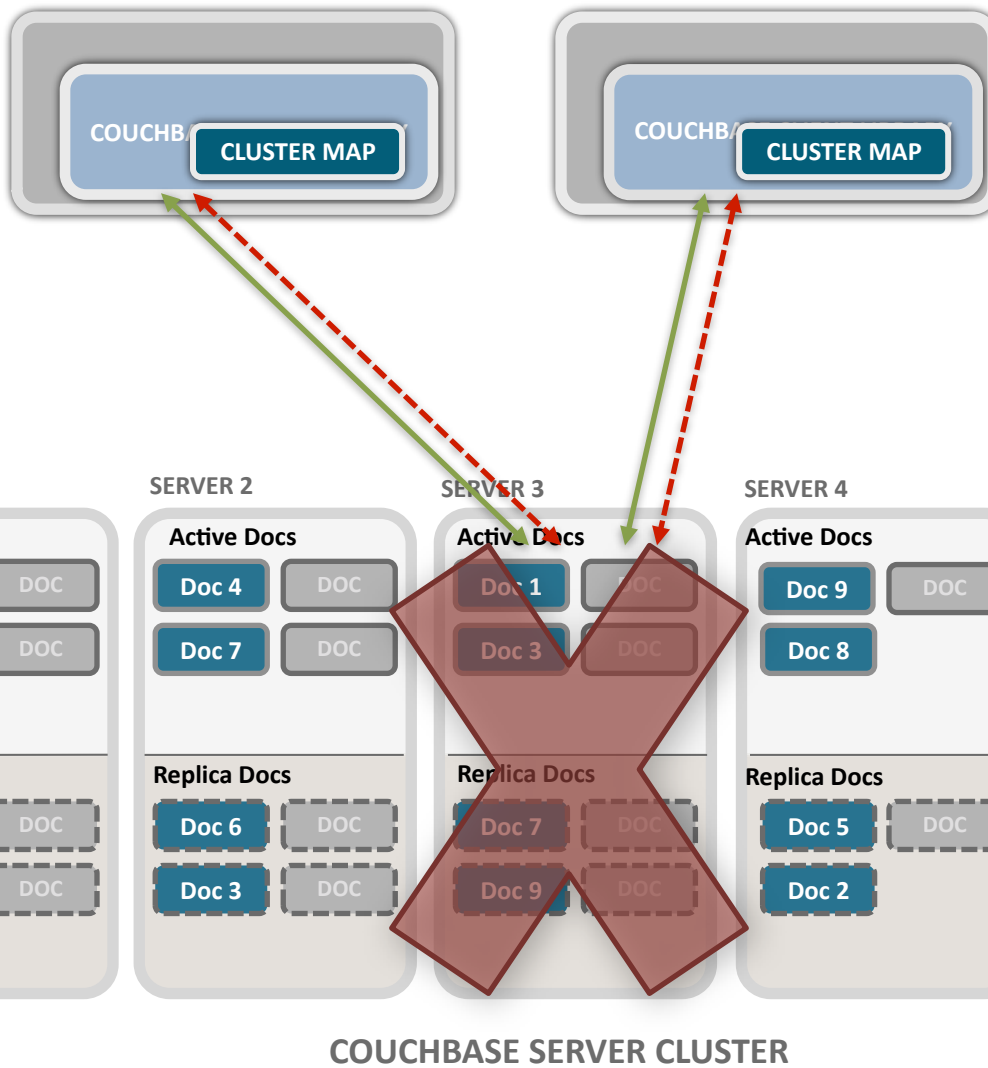

SERVER 5

COUCHBASE SERVER CLUSTER

# Fail Over Node

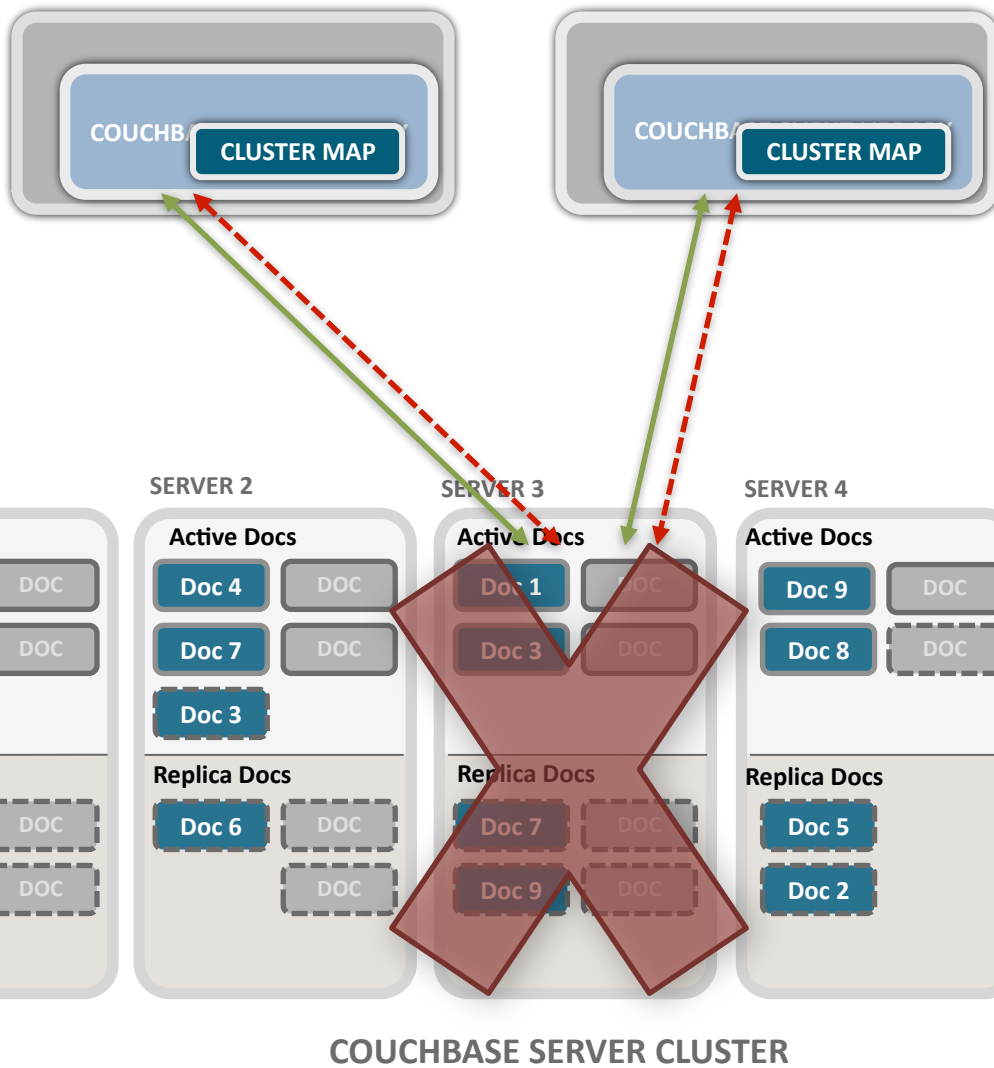

- App servers happily accessing docs on Server 3
- Server fails
- App server requests to server 3 fail
- Cluster detects server has failed
  - Promotes *replicas* of docs to *active*
  - Updates *cluster map*
- App server requests for docs now go to appropriate server
- Typically rebalance would follow

# Fail Over Node

- App servers happily accessing docs on Server 3
- Server fails
- App server requests to server 3 fail

# Fail Over Node

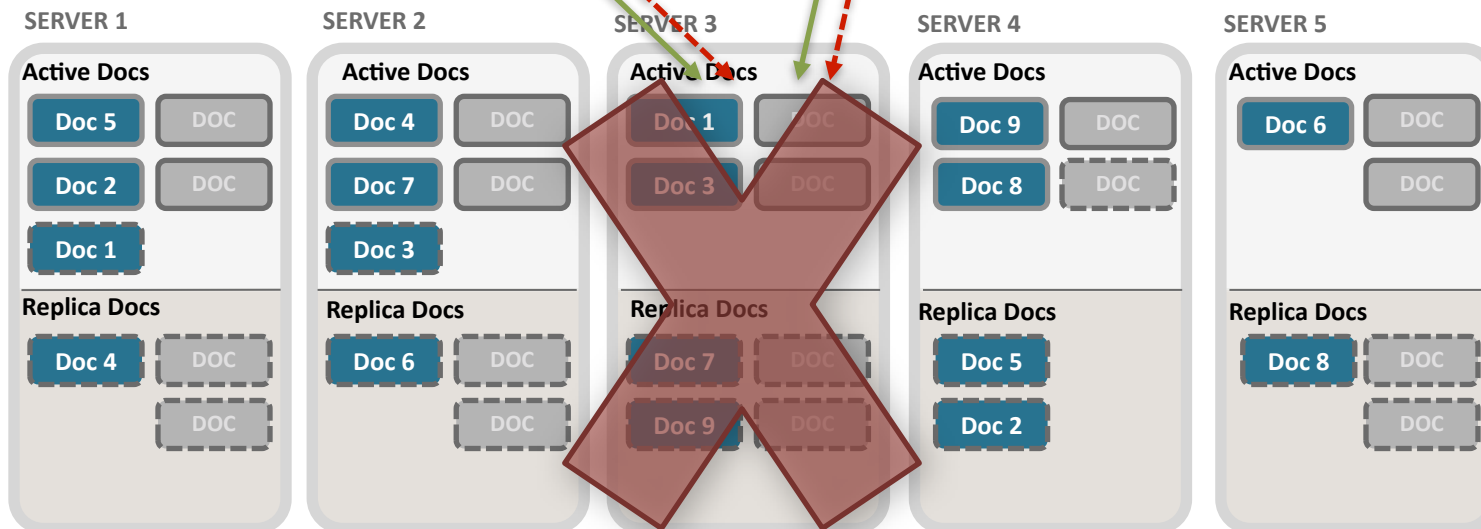

- App servers happily accessing docs on Server 3
- Server fails
- App server requests to server 3 fail

# Couchbase Server Features

- **Memcached compatible (built-in caching)**

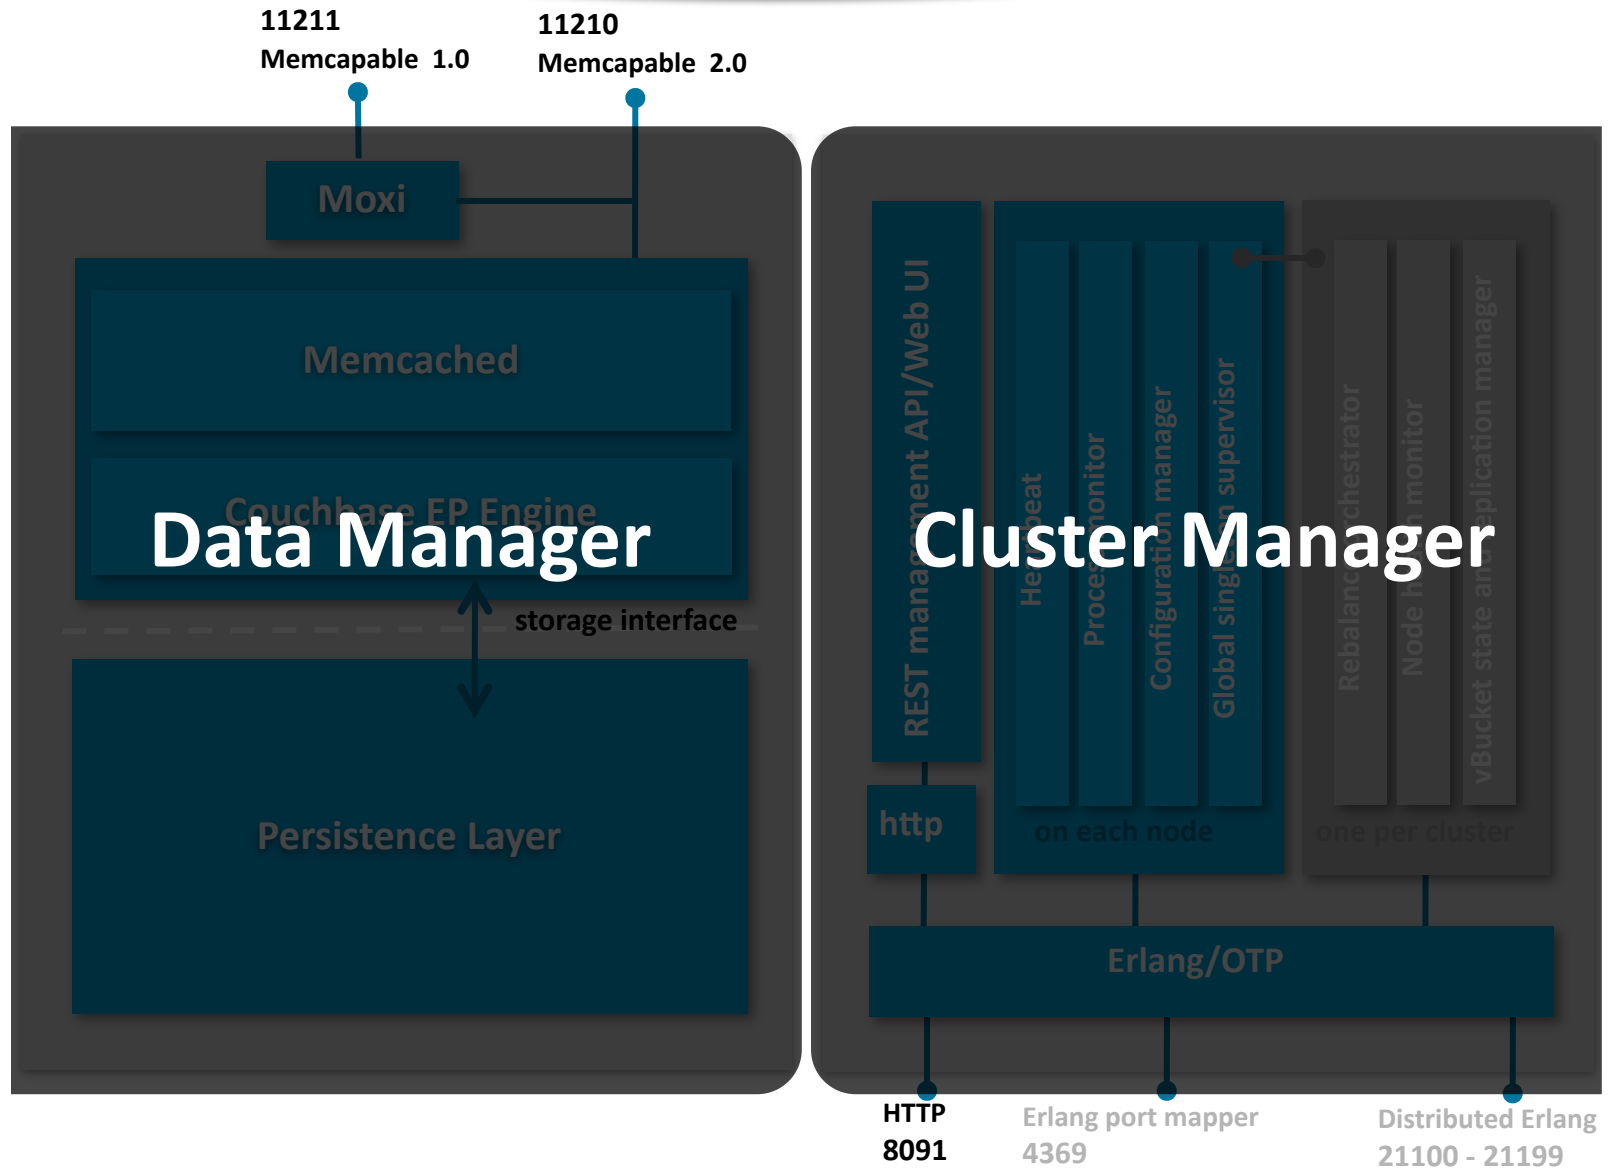

- **Monitoring and administration APIs and GUI**

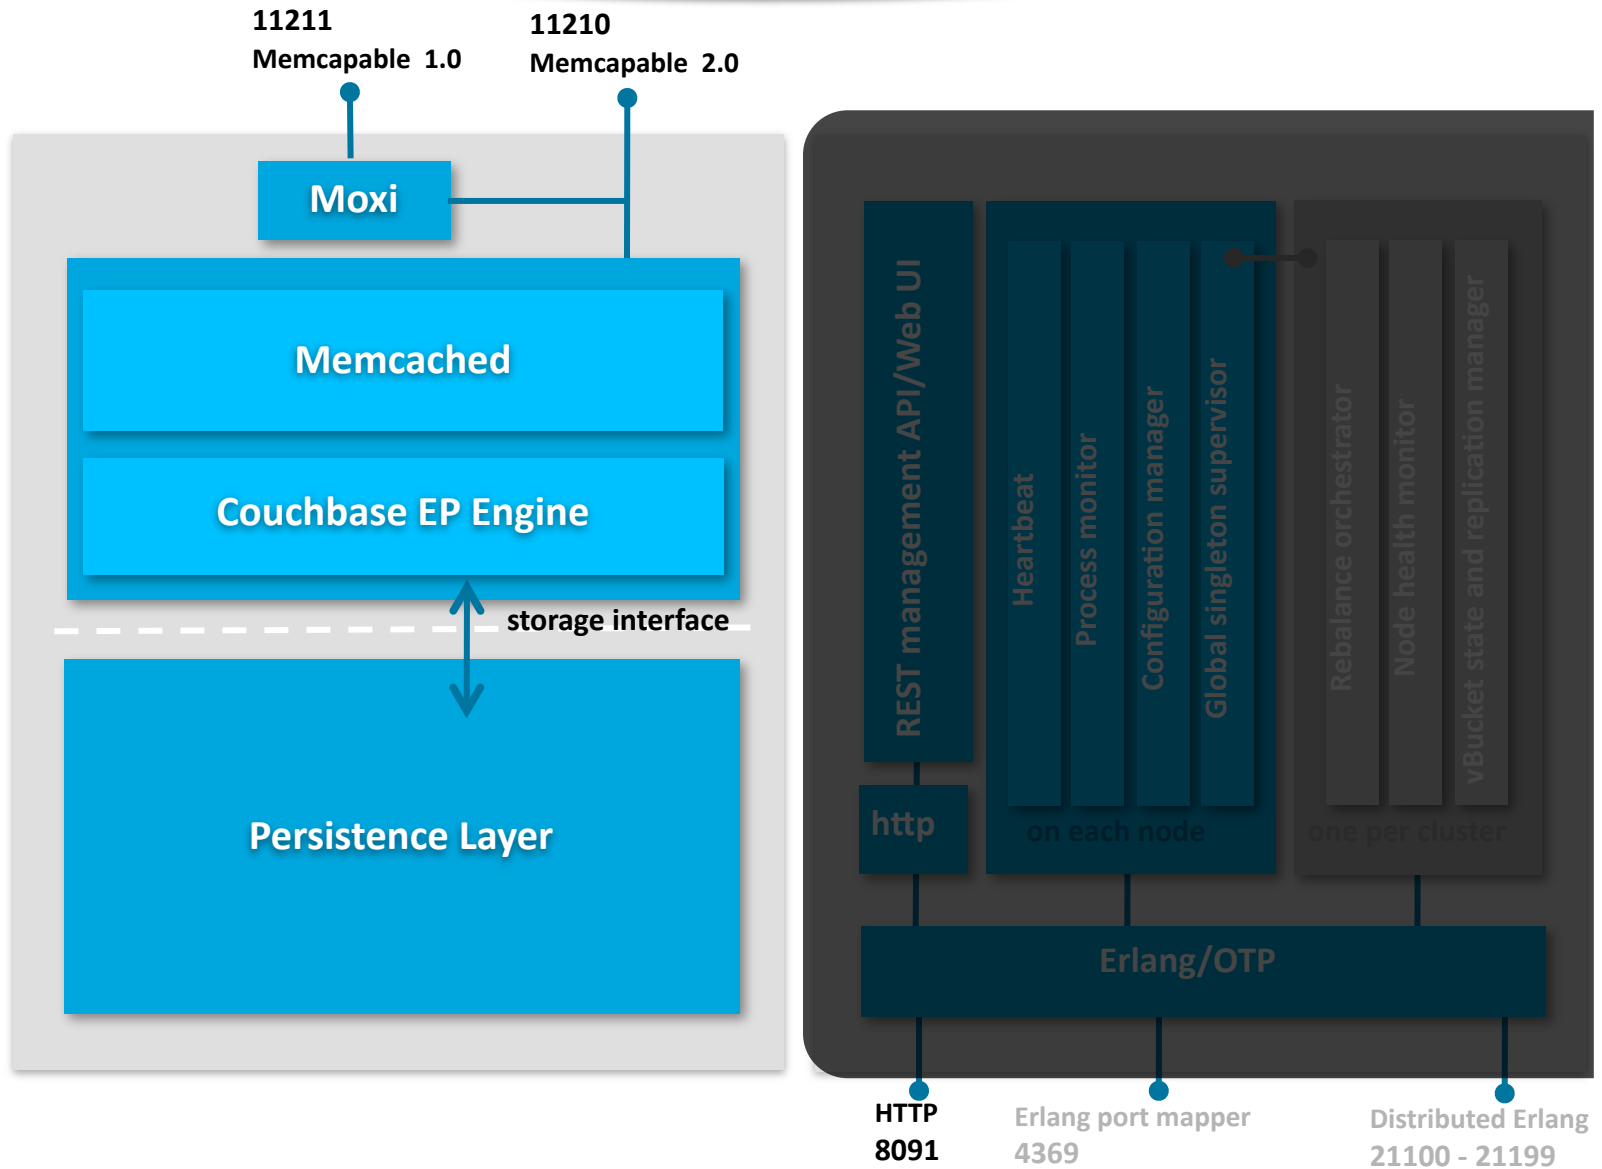

- **Reliable storage architecture**

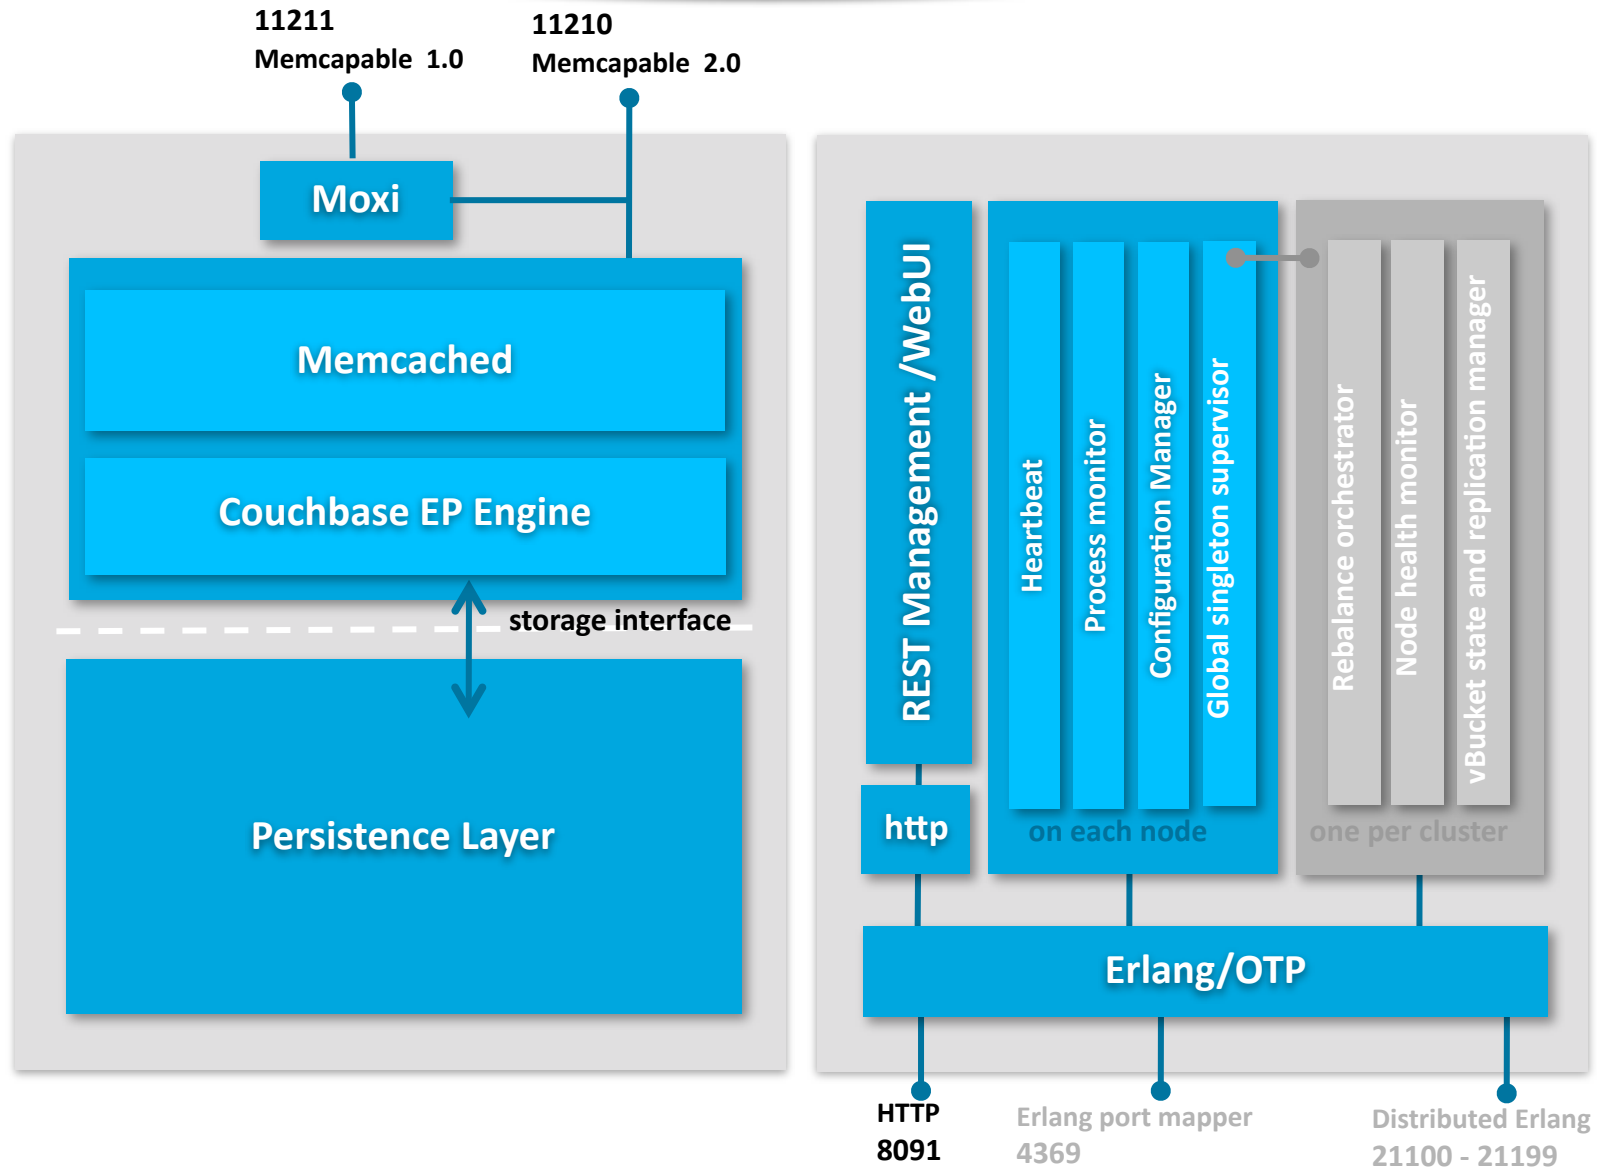

# Couchbase Server 1.8 Architecture

# Couchbase Server 1.8 Architecture

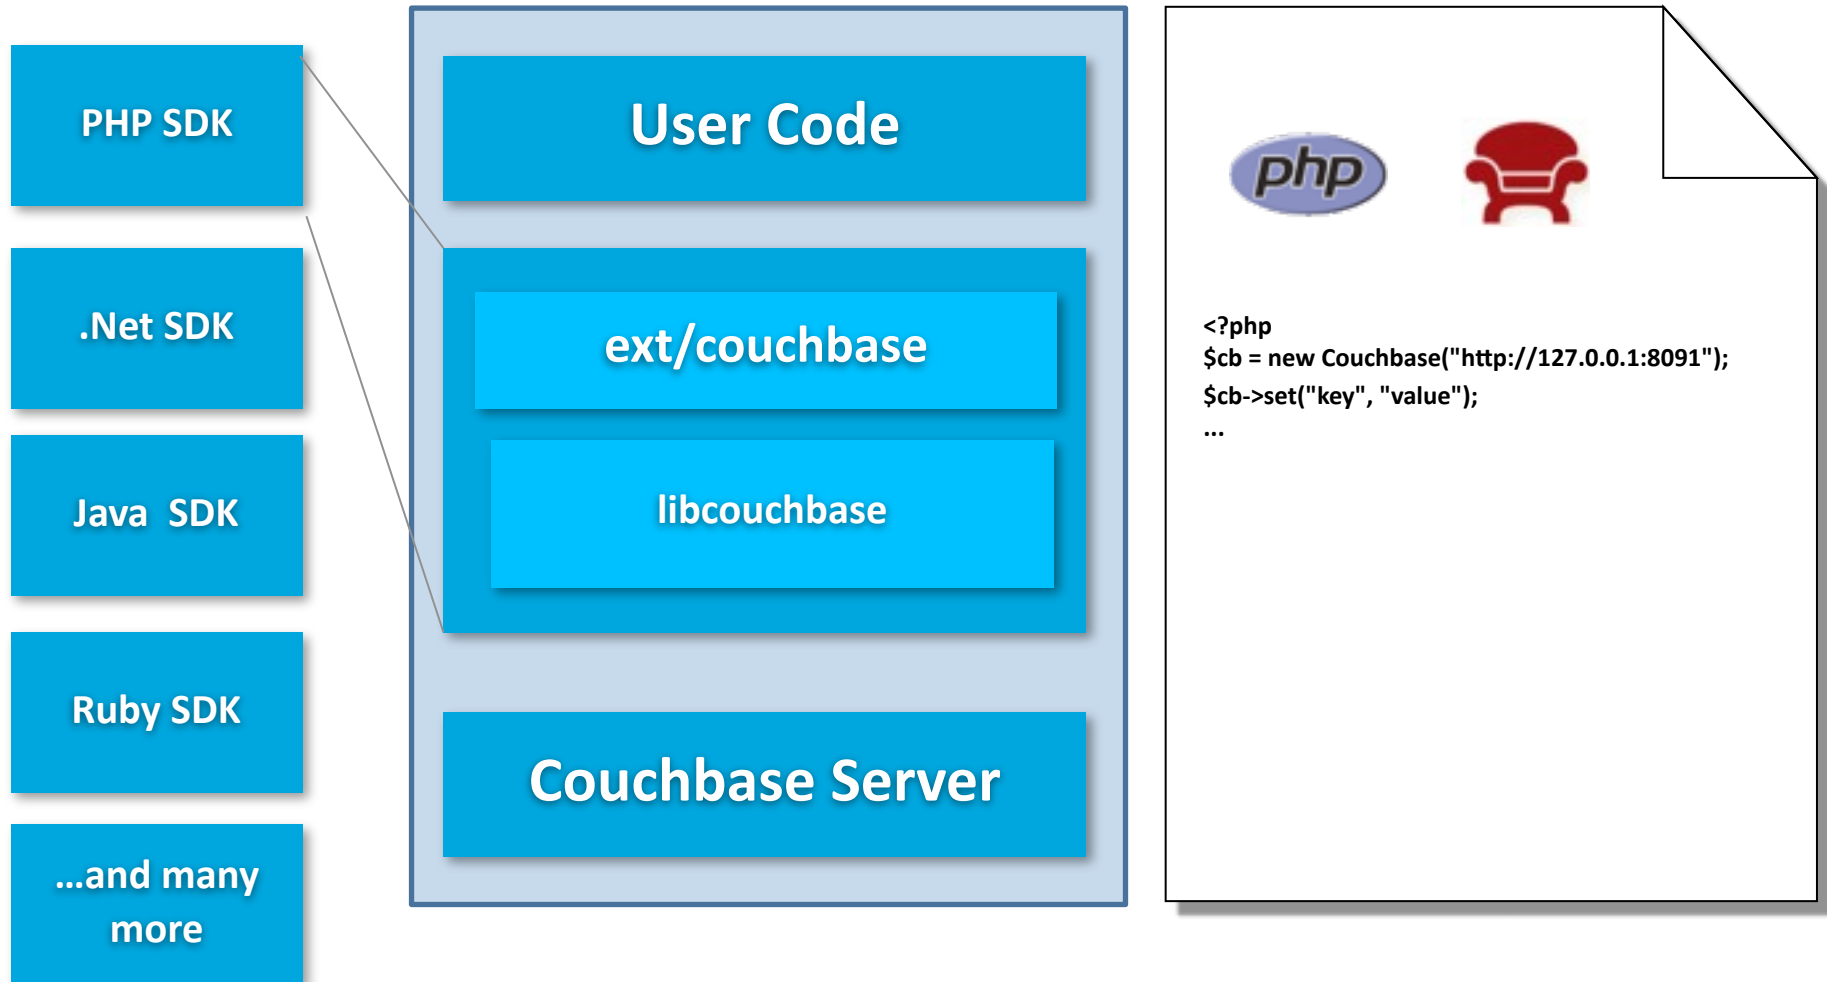

# Couchbase Server 1.8 Architecture

# Couchbase SDKs

<http://www.couchbase.com/develop>

# Couchbase Server 2.0

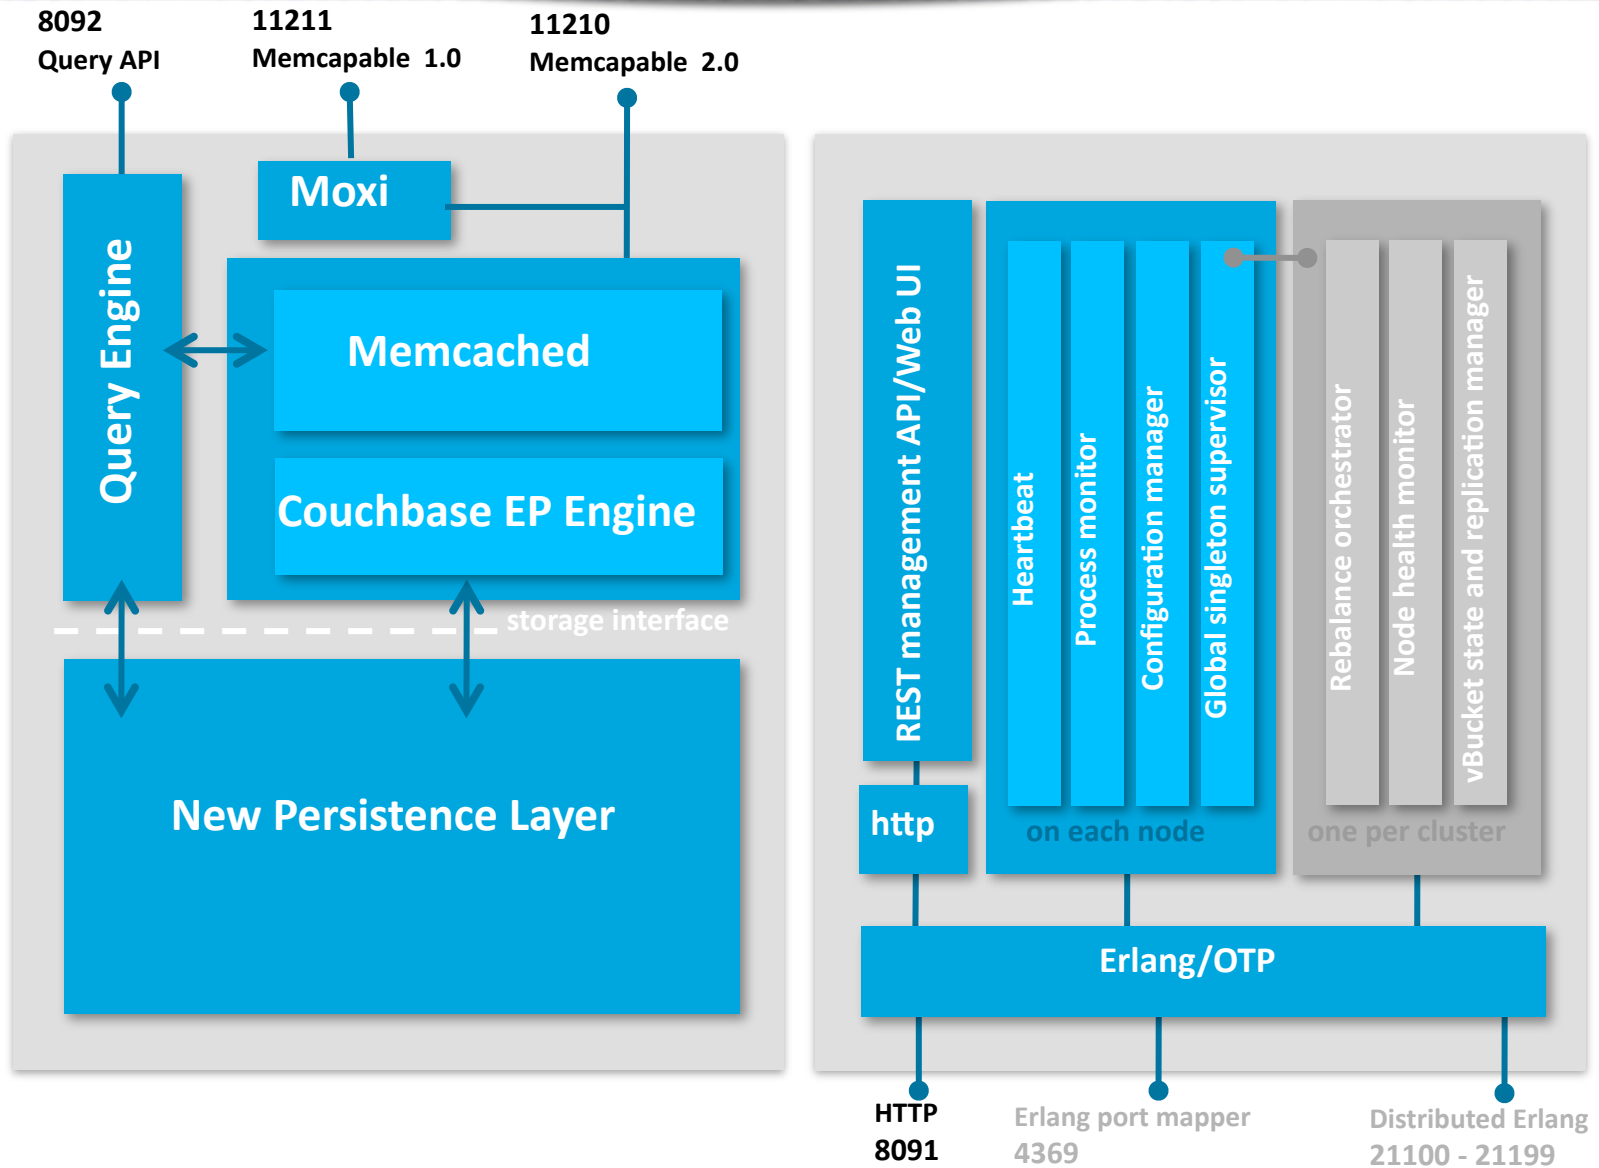

- **Next major release of Couchbase Server**
- **Currently in Developer Preview**

## **What's new:**

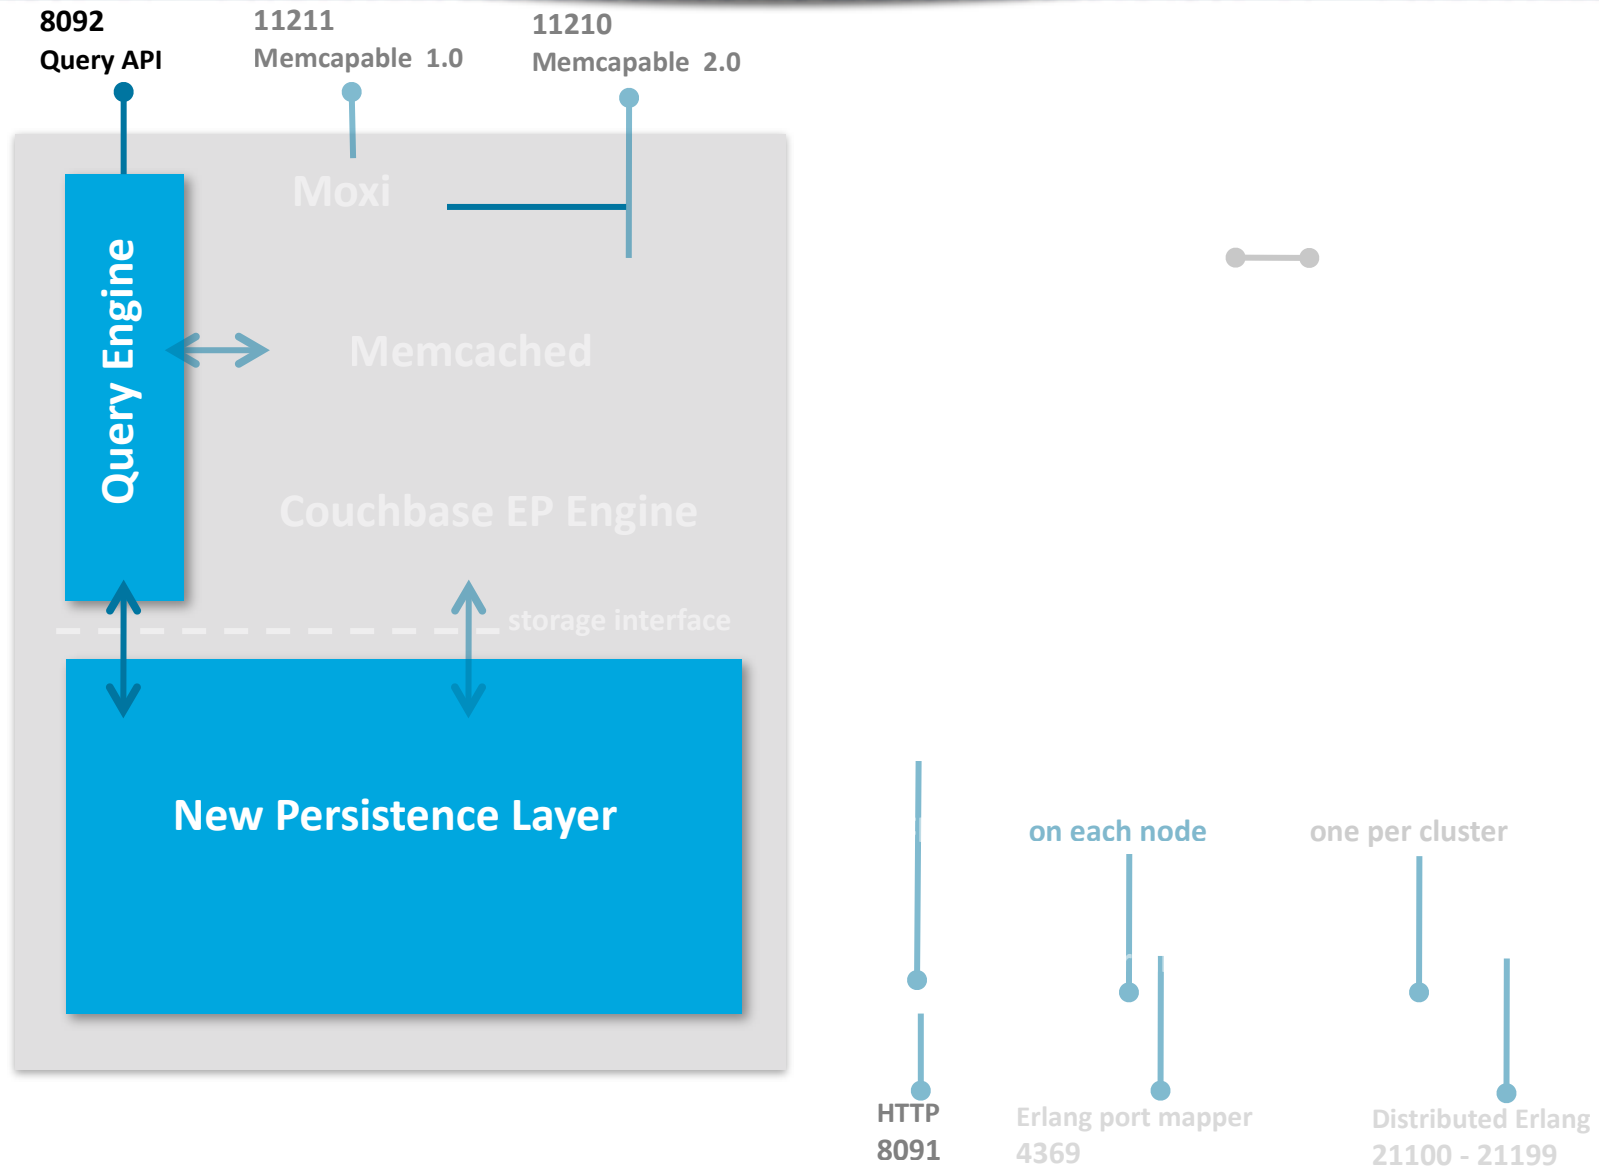

- **Indexing and Querying**
- **Incremental Map Reduce**
- **Cross Data Center Replication**
- **Fully backwards compatible with existing Couchbase Server**

# Couchbase Server 2.0 Architecture

# Couchbase Server 2.0 Architecture

# Indexing and Querying

APP SERVER 1

APP SERVER 2

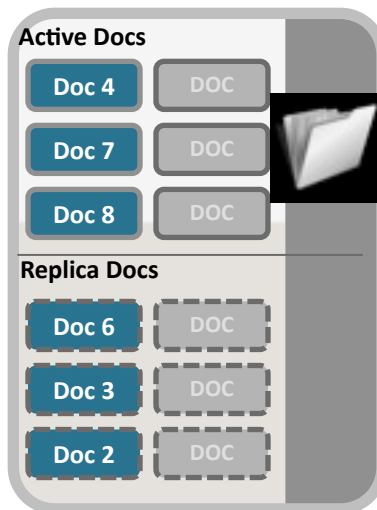

- **Indexing work is distributed amongst nodes**

- Large data set possible
- Parallelize the effort

SERVER 1

SERVER 2

SERVER 3

# Indexing and Querying

APP SERVER 1

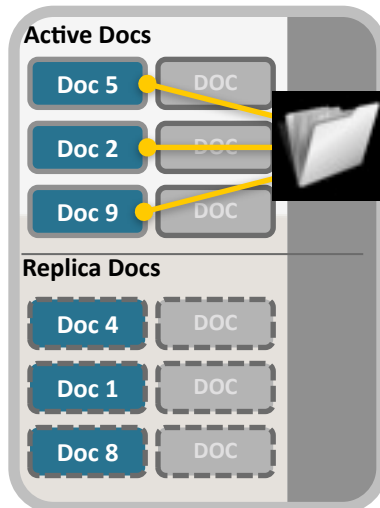

APP SERVER 2

- Indexing work is distributed amongst nodes
  - Large data set possible
  - Parallelize the effort
- Each node has index for data stored on it

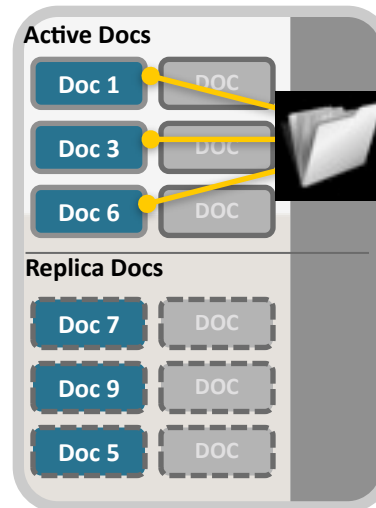

SERVER 1

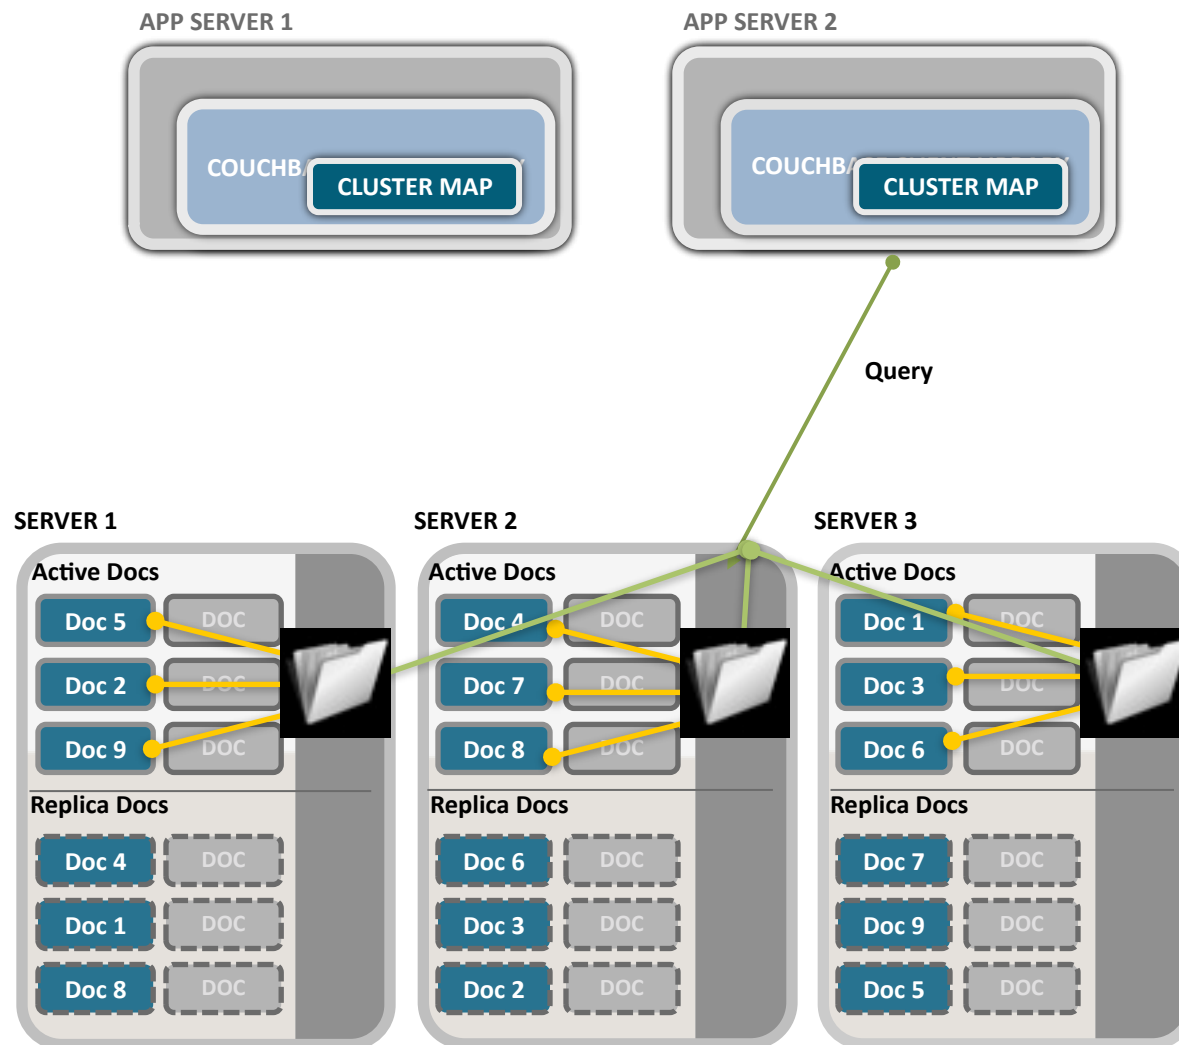

SERVER 2

SERVER 3

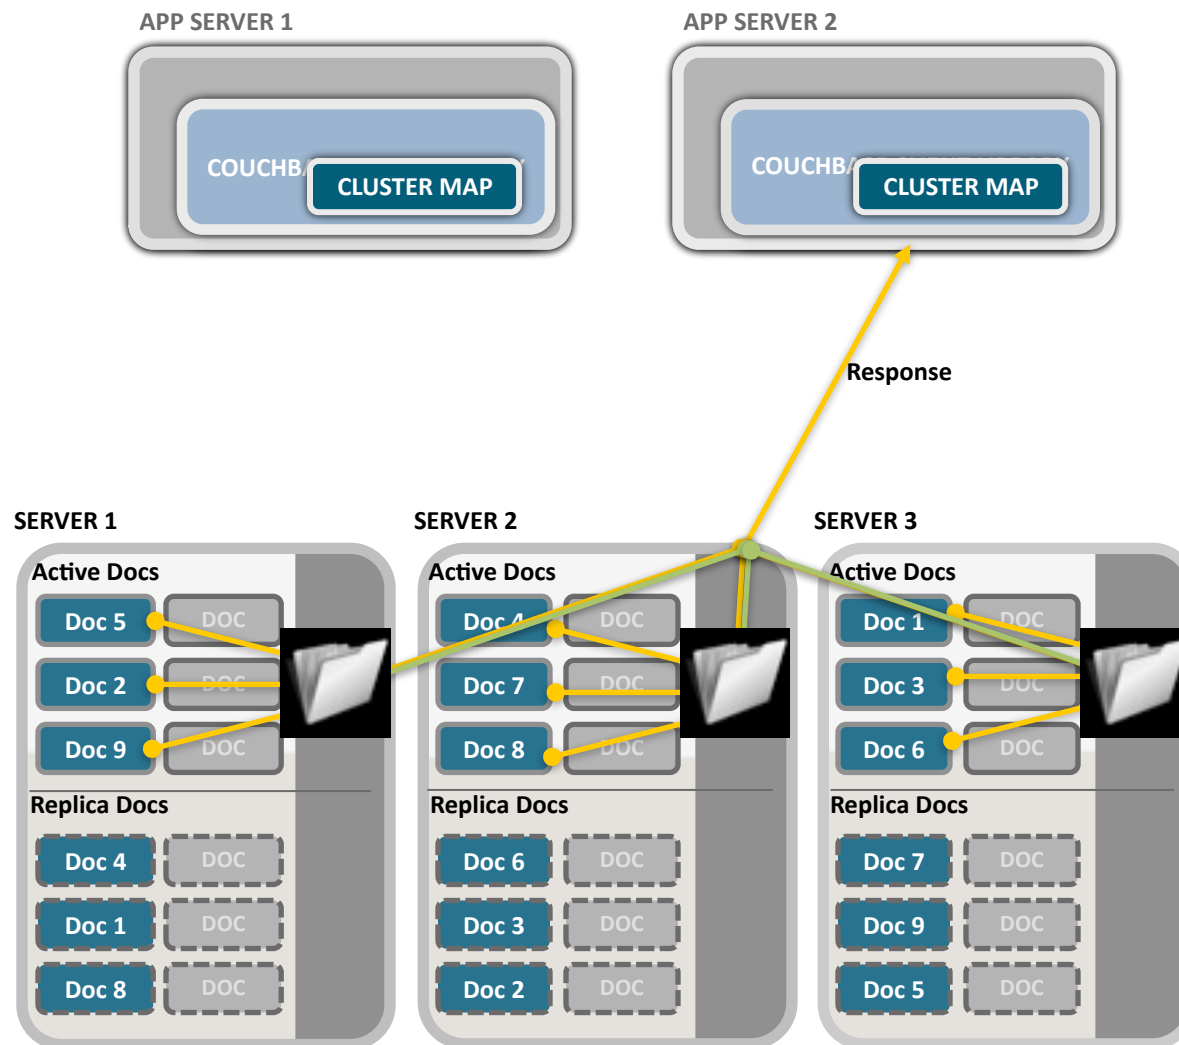

# Indexing and Querying

- Indexing work is distributed amongst nodes
  - Large data set possible
  - Parallelize the effort
- Each node has index for data stored on it

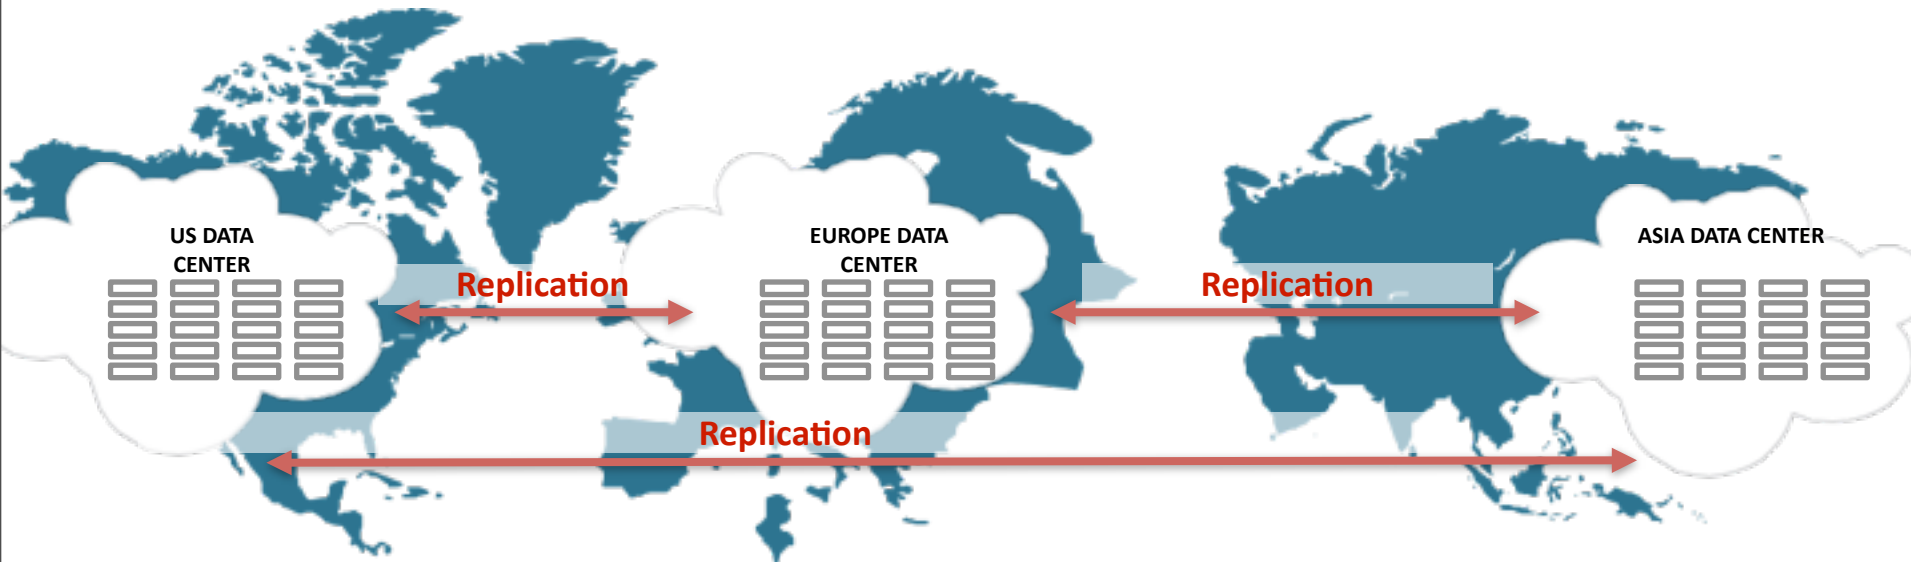

# Indexing and Querying

- Indexing work is distributed amongst nodes
  - Large data set possible
  - Parallelize the effort
- Each node has index for data stored on it
- Queries combine the results from required nodes

# Cross Data Center Replication

- Want data close to user
- Want multiple locations for disaster recovery
- Multi-Master: Can write to same document in all different regions & it will sync (eventually consistent, always available)

# EXT/COUCHBASE

# Setup

```
<?php  
$url = "http://localhost:8091/";  
$cb = new Couchbase($url);
```

# Basics

```
<?php
// setup
$cb->set("a", 1);

$a = $cb->get("a");
echo $a; // prints 1

$cb->increment("a");
echo $cb->get("a"); // prints 2
$cb->delete("a"); // booya
```

# Storage Operations

```
<?php
// set "a" to 1
$cb->set("a", 1);

// fails if "b" exists
$cb->add("b", 1);

// fails if "c" doesn't exist
$cb->replace("c", 1);
```

# Expiration

```
<?php
// set "a" to 1 for 10 seconds
$cb->set("a", 1, 10);

// most other ops can set expire

// just update the expiry
$cb->touch("a", 10);
```

# Compare And Swap

```
<?php
$cas = -1;
$cb->get("a", null, &$cas);

echo $cas; // prints 76324827359

// fails if cas doesn't match
$cb->cas($cas, "a", 2);
```

# Arithmetic

```
<?php
```

```
$cb->set("a", 1); // "a" is 1
```

```
$cb->increment("a"); // "a" is 2
```

```
$cb->increment("a", 2); // "a" is 4
```

```
$cb->decrement("a", 4); // "a" is 0
```

## Arithmetic 2

```
<?php
// increment "b" by 3, create "b"
// if it doesn't exist in which
// case, initialise it with 2, set
// no expiry

// increment($key, $offset,
//          $create, $expiry, $initial)

$cb->increment("b", 3, true, 0, 2);
```

**QUESTIONS?**
